polynucleotides (T) and polypeptides (TI) and (TI) have extostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (T) or (TI) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonucleotides of (T) can be used for detecting the presence of a cancer in a patient, by obtaining a bloiogical sample from the patient, contexting the biological sample from the patient, contexting the sample with the Oligonucleotide, detecting in the sample, amount of polynucleotide that hybridises to the oligonucleotide and comparing the amount of polynucleotide that hybridises to the oligonucleotide and comparing the amount of polynucleotide that hybridises to the oligonucleotide to a predetermine of underly and (TI) are useful in paramaceutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer.

ARQ02145 to ARQ02486 and ABR01866 to ABR01922 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel lung carcinoma polynucleotide sequences and polypeptides encoded by the polynucleotides, useful in pharmaceutical compositions such as vaccines and as markers to indicate the presence of lung cancer
                                                                                                                                                                                                                                                                                                                                                                      Vedvick TS;

Human lung tumour proteins and polynuclectides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynuclectides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABIA8959 to ABI49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80% identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polyneptide, for inhibiting proliferation of a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides of pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides creening for therapeutic compounds that modulate lung cancer, such as attended so a stargets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABUS6408-ABUS6745 represent lung cancer, such as

The present invention concerns the discovery of a new family of cell regulatory proteins (CRPs) termed the p63 family of proteins, which demonstrate certain sequence identity to known tumour suppressor proteins p53 and p73. Mouse p63 cDNA was isolated using RACE. Sequencing of the amplification product indicated that the amplified cDNA possessed a truncated N-terminus, i.e. the transactivation domain was absent. Additional splice variants were identified by screening a cDNA library with a probe corresponding to exons 5-9 of p63. At least 6 different isotypes exist. Splice variants differing at the C-terminus are designated as alpha, beta and gamma forms, while p63 members differing in the N-terminus are designated as deltaN and TA forms, where the deltaN form lacks the transactivation domain. The present sequence represents murine b53 isotype murap63 gamma. D63 was detected in a variety of channan and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate b53 reporter genes and induce apoptosis. Cessation or down-regulation of p63 expression cityities both benign and neoplastic. DeltaN isotopes of p63 expression act as dominant inegatives towards transactivation by p53 and p63. Cechexia) and neuronal differentiation and neoplastic act as dominant inegatives towards transactivation by p53 and p63. Cechexia) and neuronal differentiation and neoplastic and related degenerative considered and related degenerative considered and related degenerative considered and related degeneration or dechexia) and neuronal differentiation and neoplastic and related degenerative considered and rel disorders, p63 polypeptides (see AAY05953-64), polynucleotides (see AAX58572-83) and anti-p63 antibodies of the invention can be used to identify compounds useful for treating disorders involving such processes, in detection and diagnosis, and in the production of mouse; New isolated p63 cell regulatory protein for, e.g. treatment of Cell regulatory protein; p63; muTAp63 gamma; TAp63 gamma; cancer; tumour suppressor; cell cycle control; apoptosis; cell proliferation; cell differentiation; therapy. Mouse cell regulatory protein p63, isoform muTAp63 gamma Claim 23; Fig 17; 161pp; English. 98US-0087216. 97US-0062076. 98WO-US21992 16-AUG-1999 (first entry) (HARD) HARVARD COLLEGE. protein (HSP)-90, or selectively treating cells expressing (II)

treating genetically-defined disease with chromosomal aberration yielding oncogenic fusion protein, treating cancerous cells containing fusion protein, treating cancerous cells containing fusion protein, treating cancerous cells containing fusion protein in heterogeneous cell population, treating proliferative disease (e.g. rheumatoid arthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein (HSP)-90 (e.g. potein isoform in a patient heteroxygous for (II). The method is useful for treating a disease e.g. haematopoietic disorder such as T or B cell lymphoma, chronic myeloid leukaemia (CML), APL, ALL, AML, NHL and CMML, or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Enving's sarcoma, melanoma, liposarcoma, rhabdomyosarcoma and synovial sarcoma. The method is also useful for treating viral ciffections. This is the amino acid sequence of a human oncogenic protein.

The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (1), treating cancerous cells containing (1) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (II) dependent on heat shock protein or cellular protein isoforms (II) dependent on heat shock protein or selectively treating centeron seeful for treating administering HSSD-14nhibitor. The method is useful for treating genetically defined disease with chromosomal aberration yielding protein in heterogeneous cell population, treating proliferative disease (e.g. rheumatoid arthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein for cellular protein isoform apatient heterozygous for (II). The method is useful protein isoform in a patient heterozygous for (II). The method is useful imphoma, chronic myeloid leukemia (CML), APL, AML, AML, NHL and CMML, or a disease characterised by a solid tumour such as papillary thyroid or a disease characterised by a solid tumour such as papillary thyroid surching arcoma, melanoma, Ilposarcoma, rhabdomyosarcoma and synovial sarcoma. The method is also useful for treating viral infections. This is the amino acid sequence of a human oncogenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SPSPAIPSNTDYPGPHSFDVSFQQSSTAKSATWTYSTELKKLYCQIAKTCPIQIKVMTPP 180

It has been observed that the intron-exon organisation is conserved between p73 and p53, and from the intron sizes for these 2 genes, it was possible to identify new members of this gene family using a PCR-based strategy of amplifying 2 exons in a conserved domain and their intervening intron. The human p53 gene was localised to chromosomal position 327-29. At least 6 different isotypes exist. Splice variants differing at the C-terminus have been designated as alpha, beta and gamma forms, while p63 members differing in the N-terminus are designated as deltan and TA forms, where the deltan form lacks the transactivation domain. The present sequence represents human p53 isotype TAp63 beta. p63 was detected in a variety of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate p53 reporter genes and induce apoptosis. Cessation or down-regulation of p63 expression may play a critical role in the process of cervical squamous differentiation, both benign and neoplastic. Deltan isotopes of p63 act as dominant negatives towards transactivation by p53 and p63. p63 may also be implicated in haematopolesis, muscle wasting (e:g. cachexia) and neuronal differentiation and related degenerative disorders. p63 polypeptides (see AAX5593-64), polynucleotides (see AAX58572-83) and anti-p63 antibodies of the invention can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated p63 cell regulatory protein for, e.g. treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300
                                                               comprising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient er tracted with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

Sequence:
1 MSOSTQTNEFLSPEVFQHIW......PKQSDVFFRHSKPPNRSVYP 448
Scoring table: BLOSUM62
Gapop 10.0, Gapext 0.5
Searched:
451899 seqs, 118759770 residues
Total number of hits satisfying chosen parameters: 451899

Minimum DB seq length: 0 Maximum DB seq length: 2000000000 Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

OM protein - protein search, using sw model

August 7, 2003, 09:32:13; Search time 7.94483 Seconds (without alignments) 2651.784 Million cell updates/sec Run on:

US-09-538-106-15 2383 1 MSQSTQTNEFLSPEVFQHIW......PKQSDVFFRHSKPPNRSVXP 448 Title: Perfect score: Sequence:

BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

127863 Total number of hits satisfying chosen parameters:

127863 seqs, 47026705 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_41:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

1- FONCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LSPEVFQHIWDFLEQPICSVQPIDLNFVDEPSEDGATNKIEISMDCIRMQDSDLSDPMWP

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Brachydanio rerio (Zebrafish) (Danio rerio).

"Identification and characterization of the tumor suppressor p53 in channel catfish (Irctalurus punctatus).";
Comp. Biochem. Physiol. 1208:675-682(1998).

-i- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DGQVLGRRCFEARICACPGRDRKADEDSIRK-QQVSDSTKNGDGTKRPFRQNTHGIQM--

"Evolutionary conservancy of p53 gene sequences in fish.";
"Evolutionary conservancy of p53 gene sequences in fish.";
Submitted (JUN-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle. Fegulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

J. Vet. Med. Sci. 55:801-805(1993).
-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

Nucleic Acids Res. 16:11383-11383(1988).

- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2. SUBUNIT: Bidds DMA, as a homotetramer (By similarity).

"Isolation of CDNAs encoding the p53 tumor suppressor gene in the
"Isolation of CDNAs encoding the p53 tumor suppressor gene in the
Japanese Medaka (Oryzlas latipes).";

Submitted (MAX-1997) to the EMBL/GenBank/DDBJ databases.

-I FUNCTION: Acts as a tumor suppressor in many tumor types;

growth arrest or apoptosis depending on the physiological
circumstances and cell type. Involved in cell cycle regulation as
a trans-activator that acts to negatively regulate cell division
by controlling a set of genes regulared for this process. One of
the activated genes is an inhibitor of cyclin dependent kinases.

Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUE-Liver;
